B2 — Preview deploys / PR preview links.

A change request (or freshness PR) carries its proposed page bodies inline as

`previewFiles`

(`[[documentId, path, content]]`) — captured by the worker at open/restage time when the content

is already in hand, so a preview NEVER has to read the worker's RWO PVC. This service renders an

ephemeral overlay of those proposals on top of the live published site, gated by a stateless

HMAC token (or an org-member session).

DECOUPLING: the fall-through to the live document is done through the

`PublicDocResolver` the

CALLER passes in (ProjectService satisfies it structurally). PreviewService therefore needs no

ProjectModule dependency — it stays a leaf that only touches Prisma + Config, so no module cycle.
