ResolvedLanguage

Kind: Interface

Source: [atloria-monorepo/apps/api/src/project/language.util.ts](https://github.com/atloria-monorepo/apps/api/src/project/language.util.ts)

Language metadata for the public viewer's i18n (RTL layout + locale switcher).

Mirrors the doc generator's `_resolve_language` (atlorix tools) so a `DocVersion.language` code resolves to the same `{code, base, name, dir}` the docs were written for. `dir` drives the viewer's RTL/LTR layout; `name` (native) labels the locale switcher.

Codes are BCP-47-ish: a base language ("ar", "pt") optionally with a script or region subtag ("pt-BR", "zh-Hant"). Resolution is base-driven so any region variant of Arabic is still RTL and still labelled "العربية".

Properties

Property	Type
<code>code</code>	<code>string</code>
<code>base</code>	<code>string</code>
<code>name</code>	<code>string</code>
<code>dir</code>	<code>`ltr`</code>
