SnippetPreview

Kind: Interface

Source: `atloria-monorepo/packages/editor/src/directive-
editors/IncludeDirectiveDescriptor.tsx`

B4 reusable content — `::include{snippet="name"} .`

The directive is a REFERENCE, never a copy: the editor stores only the leaf directive; expansion happens server-side at serve time. The editor shows a read-only preview card (content fetched through `resolveSnippet` , if given) so authors see what will be included without being able to fork the text.
