TenantContext

Kind: Interface

Source: [atloria-monorepo/libs/database/src/lib/tenant-context.ts](https://github.com/atloria-monorepo/libs/database/src/lib/tenant-context.ts)

Per-request tenant context, propagated via AsyncLocalStorage.

WHY: the cross-tenant fix is enforced primarily by ResourceOrgGuard at the controller edge. This context powers a defense-in-depth BACKSTOP in PrismaService (see tenant-backstop.ts) that detects (and, once enabled, can enforce) tenant scoping on database queries — catching the bug class where a service loads a row by id and forgets to check its organization.

The context is set by an HTTP middleware from the authenticated JWT. Background work (BullMQ workers, cron, seeds, the boot-time audience seed) runs with NO context — the backstop treats an absent context as "system" and does nothing, so it can never break a background query.

Properties

Property	Type
organizationId	string
userId	string
bypass	boolean
