

Project changes and audit

September 15, 2026

Project changes and audit

Use this page to inspect proposed documentation changes, review their details, and read project activity in the audit trail.

Project changes and audit

A project change request is a proposed documentation change that you inspect before it is closed or merged. The project audit trail is the event list for project activity. Use the change request when you need to review proposed content; use the audit trail when you need to inspect recorded project events.

If you need to...	Go to
Review a proposed documentation change	Review a documentation change
Inspect conflicts, statuses, or messages	Handle statuses, conflicts, and messages
Read project events or export them	Review project audit events
Continue after a merged change	Know what happens next
Review versions	Project versions
Review audit information elsewhere	Audit reference

Before you start

You need access to a project and a reachable project-specific route before you can inspect its changes or audit trail. The changes list uses the signed-in session, and the audit page loads events for the selected project.

These surfaces do not include form fields or required markers. Use the action filter on the project audit page; use the Audit reference page for broader audit guidance.

Find a project change or audit trail

Use the project list to open the project whose documentation changes or activity you need

to inspect. The project-specific changes route redirects to the project dashboard's Changes tab. An existing change row opens its detail route.

Prerequisites

- You have access to a project.
- You know whether you are looking for a proposed documentation change or an audit event.

Steps

1. Open the project list.
2. Choose the project surface that matches your task:

If you need to...	Open
Review a proposed documentation change	The project Changes surface
Inspect project activity	The project Audit Trail

3. In the Changes surface, select a **Change row** to open its detail route.
4. On the detail route, select **Back to Changes** to return to the Changes surface.

Sync Test Project Project for testing the database sync endpoint	—	2	0	Active	Dec 2

Result: The selected project Changes surface, change detail route, or Audit Trail is on screen.

Review a documentation change

Use the change request's summary to identify the proposal and its activity entries to follow its history. A diff is the file-by-file view of additions, deletions, sections, hunks, and lines; use it to inspect the affected documentation.

A conflict section places the current text beside the proposed text so you can choose which text to keep.

Prerequisites

- You have opened a change request from the Changes surface.

Steps

1. Read the change title, kind, status, commit range, file count, and conflict count in the detail header.
2. Read the activity entries for Created, Conflicts detected, and Merged when they are present.
3. Review each affected file in the diff.
4. Compare the current and proposed text in each conflict section when conflicts are present.
5. Choose one resolution for each conflict section.

If you want to...	Select
Keep the current page text	Keep mine
Use the proposed page text	Use proposed
Change the proposed text before applying it	Edit inline

6. Select **Apply resolution** after choosing a resolution for every section.
7. Choose the action that matches the proposal:

If...	Select
The proposal is open and has no conflicts, and you need to inspect the rendered preview	Open preview
The proposal should not be merged	Close
The proposal is open and has no conflicts, and it is ready to merge	Approve & merge

Result: The change detail remains on screen with its summary, activity, affected files, diff, and the review controls available for its current status.

Review project audit events

The project audit trail is a chronological event list for project activity. Use it to read the time, actor, action, entity, and details associated with each returned event.

Prerequisites

- You have opened the project Audit Trail.

Steps

1. Select an action in **All Actions** to filter the event list.
2. Read the Time, Actor, Action, Entity, and Details columns.
3. Select an audit event row to expand its metadata.
4. Move through the event pages when the event list has more than one page:

If you need to...	Select
Return to the previous page	Previous
Open the next page	Next

5. Select **Export CSV** to request a CSV export of the project audit trail.

Result: The project audit trail shows the selected event view, expanded metadata, page range, or export control.

Handle statuses, conflicts, and messages

The Changes surface groups requests by status, and the detail surface changes its actions

when a request is open, conflicted, preparing, merging, merged, or failed. Match the status on screen to its available path.

When the screen shows...	The available path is...
Open	Open preview , Close , and Approve & merge are available when there are no conflicts.
Merged	View on Versions is available to continue to the project versions.
Closed	Review these requests in the Closed filter.
A conflict	Close , Refresh diff , and conflict-resolution cards are available.
Preparing	Wait while the branch is being prepared.

When the screen shows...	The available path is...
Merging	Wait while the merge is in progress; the Merging control is disabled.
Failed	Retry merge is available only when the failure is retryable.

Match each message to the situation that produces it.

Situation	Message
Change-list error	Failed to load change requests
Change-list loading	Loading change requests...
Change-list empty state	When your docs are edited, regenerated, or updated by an agent, the proposed changes appear here for review before they land.
Detail loading	Loading change request...
Detail loading error	Failed to load change request
Preview cannot be shared	Publish this project to share a rendered preview of the change.
Preview-link error	Failed to create preview link
Conflict banner	Conflicts to resolve – your docs changed since this was proposed. Resolve each section below, then merge.
Conflict choice required	Choose a resolution for every section
File has no line changes	No line-level changes in this file.
Change has no diff	No diff available for this change request.
Audit export error	Export failed
Audit loading	Loading...
Audit has no events	No audit events

Know what happens next

After you finish reviewing a change request, the next destination depends on the action you select. A merged request offers **View on Versions**. The audit trail remains the place to inspect project events, while the Audit reference page covers audit information more broadly.

After you...	Continue to...
Review a merged change	Project versions
Need broader audit guidance	Audit reference
Need the project list again	Projects overview
Encounter a general application error	General error messages

Result: You know which follow-on page to open for version review, audit reference information, project navigation, or general error guidance.
