What is Atloria

What Atloria is

Atloria reads a repository and turns it into a customer-facing set of documentation and support surfaces. The product describes these surfaces as a knowledge base, user manuals, an API explorer, and AI support. Together, they give readers searchable help, step-by-step guidance, API details, and cited answers.

A public trial is the no-signup route for submitting a repository URL. An authenticated workspace is the signed-in area where you manage projects and start project setup.

[Docs](#) · [Support](#) · [Marketing](#) — one repo

Your code already knows everything.

Atloria writes it all down.

Point Atloria at your repository. Get your complete customer-facing ecosystem — knowledge base, user manuals, API explorer, AI support — **always in sync, never stale.**

Generate docs

Free for public repos, no signup. A 202-entity repo like `commander.js` finishes in about a minute; a large codebase takes longer.

Use this page to choose how to begin:

If you need to...	Go to
Try documentation generation with a public repository	Start with a public repository
Sign in with an email address and password	Sign in and reach the workspace
Use an organization's single sign-on route	Sign in and reach the workspace
Choose a repository provider or continue without one	Choose a repository path in the workspace
Continue after reaching the dashboard	What to do next
Learn what you can do after setup	What can you do with Atloria

Before you enter the workspace

The dashboard is the authenticated workspace. The first-project wizard is its starting point for

connecting code to a project. A repository provider is GitHub, GitLab, or Bitbucket.

Single sign-on

is the organization route that uses a work email or organization ID.

Prepare one of these starting points:

Starting point	What to have ready
Public trial	A repository URL, or an example repository to select
Email sign-in	Your email address and password
Single sign-on	Your work email or organization ID
First-project wizard	A repository URL, a connected provider, or a decision to create without a repository

The dashboard fetches projects and contains the onboarding checklist and first-project wizard. After a successful sign-in, Atloria routes you to `/app` and refreshes the page.

Choose how to start

From the home page, choose the route that matches your goal.

If you want to...	Select
Try a public repository	Try it free
Open the sign-in page	Login
Begin a free account route	Start free →
Use the product-purpose links	Product or Groundedness

The home page also displays **Pricing** and live product summaries, including repos connected, docs generated, languages and frameworks, citation validity, and manual quality. Its repository prompt begins with `github.com/` and sits beside **Generate docs**.

Start with a public repository

The public trial lets you submit a repository URL without signing up. The repository field accepts a URL, and the page also offers example repositories that fill the field when selected.

Prerequisites

- Have a public repository URL ready, or choose one of the displayed examples.

Steps

1. Open **Try it free** from the home page.
2. Enter the URL in **Repository URL**.
3. Select **Generate docs**.
4. When generation completes, select **Open your docs hub** → to open the generated hub.
5. Select **Copy link** when you need the hub address on your clipboard.

Result: Atloria starts documentation generation for the repository; after completion, the page offers **Open your docs hub** → and **Copy link**.

If the request fails, the page displays the returned error message or HTTP status. During a failed generation, the page displays the generation error returned by the job: “Generation failed: {status.job.error}”.

Sign in and reach the workspace

The sign-in page is the route for an existing account or an organization that uses single sign-on.

Prerequisites

- Have your email address and password, or your work email or organization ID for SSO.

Steps

1. Open **Login** from the home page.
2. Enter your email address in **Email address**.
3. Enter your password in **Password**.
4. Select **Sign in**.
5. Choose one sign-in route:

If you want to...	Actions
Sign in with an email address and password	Select Sign in .
Use your organization's single sign-on	Select Continue with SSO . Enter your details in Work email or organization ID . Select Continue with SSO again.

Result: A successful credentials sign-in routes you to `/app` and refreshes the workspace.

The sign-in page also provides **Sign up** for a new account and **Forgot your password?** for password recovery.

Choose a repository path in the workspace

The first-project wizard is the workspace starting point for connecting code to an Atloria project.

It offers separate routes for a valid repository URL, a connected provider, and a project without a repository.

Prerequisites

- Reach the authenticated workspace.

Steps

1. In the first-project wizard, choose one route:

If you want to...	Select
Enter a repository URL	Enter the URL, then select Get Started →
Browse a connected provider	Select GitHub , GitLab , or Bitbucket
Create a project without code connected yet	Select Create without a repository

2. In repository browsing, search with **Search repositories...** when you need to narrow the list.

Result: The wizard proceeds with the selected repository route or starts a project without a repository. A valid detected provider allows **Get Started** → to proceed. A connected provider opens repository browsing; a provider that is not connected opens provider connection first.

When entry or generation fails

Use the exact message on screen to choose the recovery action.

What you see	What to do
Invalid email or password	Check Email address and Password , then select Sign in again.
No SSO connection was found for that email. Check with your administrator.	Check the work email or organization ID, or contact your administrator.
Could not start SSO. Please try again.	Select Continue with SSO again.
Your organization requires single sign-on. Continue with SSO below.	Use the SSO field and select Continue with SSO .
Single sign-on could not be completed.	Return to sign-in and retry the SSO route.
Please enter a valid GitHub, GitLab, or Bitbucket repository URL	Correct the repository URL, then select Get Started → .
Failed to load repositories. Please try again.	Retry repository browsing.
Failed to create project	The page displays the project-creation error returned by the request.

What you see	What to do
A returned HTTP status	The page displays the returned generation error.
A generation error	Read the generation error and correct the reported problem.

What to do next

After you choose an entry route, continue with the page that matches your next task:

Next task	Continue with
Complete account access	Your first day
Learn the dashboard shell	Understanding the interface
Move between workspace destinations	Navigation basics
Create the first project	Create a project
Explore the product capabilities	What can you do with Atloria
Check access and environment needs	System requirements
Find general error guidance	General error messages

The dashboard is titled **Dashboard** and can include project, generation, and chat-answer activity summaries. It can also display **Get started with Atloria**, including **Connect a repo** and **Dismiss get started checklist**.
