

Create an account

September 15, 2026

Create an account

Create an account when you need to use Conduit's authenticated features for the first time.

Registration is available at `/register` .

If you need to...	Go to
Check what registration is for	Create an account
Confirm what you need before starting	Before you start
Reach the registration form	Open the Register screen
Identify the fields and controls	Understand the registration form
Submit your registration	Enter details and sign up
Resolve an authentication error	When registration goes wrong
Sign in with an existing account	Sign in
Read shared authentication messages	Authentication and loading messages

Before you start

You need to be signed out to open the registration form. Have a username, email address, and password ready before you begin.

Before starting	What to have ready
Access	A signed-out session
Account name	The username you want to use
Contact	The email address for the account
Sign-in secret	The password for the account

If you already have an account, use [Sign in](#) instead.

Open the Register screen

The Register screen is the public entry point for creating a Conduit account.

Prerequisites

- You are signed out.

Steps

1. Open `/register` in your browser.

Result: The Register screen opens with the registration form.

Understand the registration form

The registration form collects the three details needed to submit an account request and places authentication errors above the form.

What you need to do	Control or area	What it does
Enter the account name	Username	Accepts the username for the new account
Enter the account email	Email	Accepts the email address for the new account
Enter the sign-in secret	Password	Accepts the password as a password field
Submit the details	Sign up	Submits the registration form
Read a registration error	Authentication error area	Lists the response errors above the form

Username appears for registration. **Email** and **Password** remain on the authentication

form. The form requires all three fields, and **Sign up** is unavailable while the form is invalid. While submission is in progress, the form fields are disabled.

The inputs use their visible placeholder text rather than separate field labels. The screen does not add a field-level validation message, confirmation dialog, or grid.

Enter details and sign up

Use this procedure to send the three required account details and continue to the application's main route after a successful response.

Prerequisites

- The Register screen is open.
- You have the username, email address, and password you want to submit.

Steps

1. Enter the account name in **Username**.
2. Enter the account email address in **Email**.
3. Enter the account password in **Password**.
4. Select **Sign up**.

Result: The registration request is submitted. A successful response takes you to `/`.

When registration goes wrong

If registration returns an error, read it in the authentication error area above the form.

What you see	What it means	What to do
An authentication error in the error list	The registration response contains one or more errors	Read the listed error and correct the relevant registration detail before selecting Sign up again

Each API error is rendered as `<key> <value>` in an error list. No fixed authentication error text is used by the registration screen.

[Authentication and loading messages](#) covers shared authentication messages outside this registration error area.
