View My Posts and Favorited Posts

Overview

A profile's **My Posts** list contains articles written by that profile. **Favorited Posts** contains articles that profile has marked as favorites. Use the first list to find the profile's own articles and the second to revisit articles the profile chose to keep.

If you need to...	Go to
Find articles written by the profile	Switch between My Posts and Favorited Posts
Revisit articles the profile has favorited	Switch between My Posts and Favorited Posts
Read an article from either list	What to do next
Open a profile and review its basic information	View a profile
Find your way around profile destinations	Navigation basics

Prerequisites

Before you start, have an article preview with an author name at its top. The profile information and its two list tabs appear after the profile loads. If you plan to use the favorite action on an article, use the signed-in route required for that action.

Find and open a profile

Open the profile from the author name so the application supplies the profile to the parameterized profile route.

Prerequisites

- You are on a page that contains a profile link.

Steps

1. Select the author name at the top of the article preview.
2. When the profile page finishes loading, select the list that matches your task:

If you need to...	Select
Review articles written by the profile	My Posts
Review articles the profile has favorited	Favorited Posts

The profile page uses the profile route, and its list tabs use the profile route's empty child route and `favorites` child route.

Result: The profile page is open with the list you selected.

Understand the profile lists

The profile area identifies the profile with its username and bio, then places the two article lists below the profile information. The lists show articles rather than editable article fields.

Surface	What you use it for
Username	Identify the profile currently open
Bio	Read the profile's description
My Posts	Open articles authored by the profile
Favorited Posts	Open articles favorited by the profile
Article results	Open or review articles returned for the selected list
Page numbers	Move through additional result pages when they are available

While the list loads, it displays `Loading articles...`. If the selected list has no results, it displays `No articles are here... yet.`

Switch between My Posts and Favorited Posts

Use this procedure when you want to compare the profile's authored articles with the articles the

profile has favorited.

Prerequisites

- You have opened the profile page.

Steps

1. Select **My Posts**.
2. Review the authored-article list.
3. Select **Favorited Posts**.
4. Review the favorited-article list.

Result: The profile's favorited-article list is open. Select **My Posts** whenever you need to return to the profile's authored articles.

Handle list variations

Each selected list can show a loading message, no results, one page, or several pages. Article previews also provide actions for opening an article and changing its favorite state.

What you see	What to do
Loading articles...	When the message appears, continue after the article results or empty-list message appears.
No articles are here... yet.	Select the other list if you need to check the profile's other collection.
More than one page number	Select the page number you need.
An article preview	Select Read more... to open that article.
The favorite action on an article preview	Select the favorite action to change the article's favorite state.

Prerequisites

- You have opened either **My Posts** or **Favorited Posts**.

Steps

1. When Loading articles... appears, continue after the article results or empty-list message appears.
2. If the list has more than one page, select the required page number.

3. If you want to open an article, select **Read more...** on its preview.

Result: The selected article page is open, or the requested result page is displayed.

When profile loading goes wrong

If the profile cannot load, the profile page uses the message `Failed to load profile`.

What you see	What it means	What to do
<code>Failed to load profile</code>	The profile page could not load the requested profile.	Return to the page with the in-app profile link and select the profile again.

What to do next

After you find the article or profile action you need, continue with the page that owns that work.

If you want to...	Continue with
Read the selected article	Read an article
Change an article's favorite state	Favorite articles
Follow the profile	Follow a user
Change your profile settings	Update settings

Select **Read more...** on an article preview to open the selected article.
