Getting help

Support references are the project links you use when you need to try Conduit, inspect its API, read its source, or learn how the codebase works.

If you need to...	Go to
Choose the right external reference	Before you start
Try the application	Demo in the support-reference table below
Inspect API routes and responses	API spec here in the support-reference table below
Read the application source	main RealWorld repo in the support-reference table below
Learn how the codebase's patterns work	our wiki in the support-reference table below

Before you start

Before choosing a reference, identify whether you need to try Conduit, inspect its API, read its source, or learn how the codebase works. The project describes Conduit as a React and Redux codebase and lists four separate destinations for those needs.

Use the project README as the starting point, then continue to [Choose a support reference](#).

The application itself does not provide a support-reference area.

Choose a support reference

Use this procedure when you need help outside the application.

Prerequisites

- You know which kind of help you need.

Steps

1. Open the project README.
2. Select the matching link in the support-reference table above.

If you need to...	Select
Try the application	Demo or the live demo link
Inspect API routes and responses	API spec here
Read the application source	main RealWorld repo
Learn how the codebase's patterns work	our wiki

Result: The reference that matches your question is open.
