dirname

Kind: Function**Source:** `src/helper/ssg/utils.ts`**Part of:** [Helper](#)

Get dirname

`dirname` gets the directory portion of a file or path string. It supports static-site-generation helpers that need to locate a file's parent directory before resolving related paths or writing output.

Signature

```
function dirname(path: string): string
```

Parameters

Name	Type
<code>path</code>	<code>string</code>

Returns: `string`

Diagram

```
graph LR
  A[Path string] --> B[dirname]
  B --> C[Directory path]
```

Usage

```
import { dirname } from '../src/helper/ssg/utils'

const filePath = 'content/guides/setup.mdx'
const directory = dirname(filePath)

console.log(directory)
```

AI Coding Instructions

- Pass a path string representing a file or nested resource.
- Use the returned directory path when resolving files relative to the current resource.
- Keep path-format handling consistent with other SSG utilities.
- Check callers that may pass root-level paths or paths without directory segments.

Relationships

- IMPORTS → METHOD_NAME_ALL
- IMPORTS → findTargetHandler
- IMPORTS → isMiddleware

Used by

1 reference from 1 file. Each is a place in this repository where the symbol is actually used — go read one rather than trusting an example.
