getConnInfo

Kind: Function**Source:** `src/adapter/netlify/conninfo.ts`**Part of:** [Adapter](#)

Get connection information from Netlify

`getConnInfo` retrieves connection information from the Netlify adapter. It acts as the Netlify-specific source for connection data used by the surrounding adapter flow.

Signature

```
function getConnInfo(c: Context<Env>)
```

Parameters

Name	Type
<code>c</code>	<code>Context<Env></code>

Diagram

```
graph LR

  B --> C[Netlify adapter]
  C --> D[Connection information]
  D --> A
```

Usage

```
import { getConnInfo } from './adapter/netlify/conninfo';

const connectionInfo = await getConnInfo();

console.log(connectionInfo);
```

AI Coding Instructions

- Keep Netlify-specific connection lookup logic inside the Netlify adapter.
- Treat the return value as adapter data; avoid duplicating Netlify environment handling in callers.
- Handle missing or invalid connection data at the integration boundary.
- Update callers when the connection information shape changes.
