getConnInfo

Kind: Function

Source: `src/adapters/bun/conninfo.ts`

Part of: [Adapter](#)

Get ConnInfo with Bun

`getConnInfo` reads connection details for the current request when running on Bun. It is intended for handlers that need access to request connection metadata through the Bun adapter.

Signature

```
function getConnInfo(c: Context)
```

Parameters

Name	Type
<code>c</code>	<code>Context</code>

Diagram

```
graph LR
  Request --> Context
  Context --> getConnInfo
  getConnInfo --> BunServer
  BunServer --> ConnInfo
  ConnInfo --> Handler
```

Usage

```
import { Hono } from 'hono'
import { getConnInfo } from 'hono/bun'

const app = new Hono()

app.get('/connection', (c) => {
  const connInfo = getConnInfo(c)

  return c.json(connInfo)
})

export default app
```

AI Coding Instructions

- Call `getConnInfo` from a request handler with the active Hono context.
- Use this Bun-specific helper only when the application is running with the Bun adapter.
- Keep connection metadata handling separate from request parsing and response creation.
- Handle missing or unavailable connection details before relying on them for application logic.

Relationships

- IMPORTS → `getBunServer`
