routePath

Kind: Function

Source: `src/helper/route/index.ts`

Part of: [Helper](#)

Get the route path registered within the handler

`routePath` reads the route path associated with a registered handler. Use it when middleware, diagnostics, or route-aware code needs the path stored on a handler instead of rebuilding it from request data.

Signature

```
function routePath(c: Context, index: number): string
```

Parameters

Name	Type
<code>c</code>	<code>Context</code>
<code>index</code>	<code>number</code>

Returns: `string`

Diagram

```
graph LR
  Handler[Registered handler] --> RoutePath[routePath]
  RoutePath --> Path[Registered route path]
```

Usage

```
import { routePath } from './helper/route';

const registeredPath = routePath(userHandler);

console.log(`Handler is registered for: ${registeredPath}`);
```

AI Coding Instructions

- Call `routePath` with the handler that was registered with the router.
- Keep route metadata attached to the handler when wrapping or composing handlers.
- Do not derive the registered path from the incoming request when handler metadata is available.
- Use the returned path for logging, diagnostics, or route-aware middleware behavior.
