Kind: Interface

Source: `src/types.ts`

`HTTPResponseError` describes an error object that exposes a `Response` through `getResponse()`. Error-handling code can detect this interface and return the associated response instead of creating a new error response.

1 Properties

Property	Type
<code>getResponse</code>	<code>() => Response</code>

2 Diagram

3 Usage

```
interface HTTPResponseError {
  getResponse: () => Response
}

const isHTTPResponseError = (error: unknown): error is HTTPResponseError => {
  return (
    typeof error === 'object' &&
    error !== null &&
    'getResponse' in error &&
    typeof error.getResponse === 'function'
  )
}

try {
  throw {
    getResponse: () => new Response('Access denied'),
  }
} catch (error) {
```
