Pams.Email

Kind: Module

Source: Pams/Logic/Pams.Email/Pams.Email.csproj (line 1)

Part of: [Pams](#)

.NET project in solution

`Pams.Email` is a .NET project within the Pams solution that groups email-related application code. A host project references this module, supplies configuration and dependencies, and invokes its email behavior as part of the wider application flow.

Diagram

```

    EmailProject --> EmailCode[Email-related .NET code]
    HostProject[Referencing host project] --> EmailProject
    HostProject --> Client[Application client]
```

Usage

```
type SendEmailRequest = {
  to: string;
  subject: string;
  body: string;
};

export async function sendEmail(
  request: SendEmailRequest,
): Promise<void> {
  // The host application should expose Pams.Email through its own API.
  const response = await fetch("/api/email/send", {
    method: "POST",
    headers: {
```

```

        "Content-Type": "application/json",
    },
    body: JSON.stringify(request),
});

if (!response.ok) {
    throw new Error("Email request failed");
}
}

await sendEmail({
    to: "user@example.com",
    subject: "Account update",
    body: "Your account details have been updated.",
});

```

AI Coding Instructions

- Keep email behavior inside `Pams.Email` ; let host projects handle HTTP endpoints, dependency registration, and environment configuration.
- Reference the `Pams.Email` project from the consuming .NET project instead of duplicating email logic in the host.
- Do not expose email provider details directly to JavaScript clients; call an application API that is backed by the .NET host.
- Keep request validation and error handling explicit at the host boundary before invoking email-related code.

Relationships

- `DEPENDS_ON` → `log4net`
- `DEPENDS_ON` → `Microsoft.Exchange.WebServices`
- `DEPENDS_ON` → `Microsoft.Exchange.WebServices.Auth`
