General error messages

General error messages

Check the Notifications screen for error-message behaviour.

The Notifications screen is the place where notification requests, reminders, and assignment actions appear.

If you need to...	Go to
Reach the notification list and identify its visible tabs	Open Notifications and identify the visible message
Distinguish notification content from an error message	Inspect the notification state
Check what is known about a failed notification operation	When a notification operation fails
Continue after checking the result	Continue from the result
Get help with a failure that still needs investigation	Getting help

The screen has no success or error message entries. Switching notification tabs does not show an error, validation, confirmation, or success message.

Before you start

The Notifications screen shows notification activity and provides controls for notification requests, marking notifications as read, and accepting or declining assignments.

Prerequisites

- Know whether you are checking notification loading, **Mark all as read**, or an assignment action.
- Open the notification route `/notifications`.

- Treat the response to a failed request as unconfirmed.

The screen loads notifications when it is opened outside the popup. The notification-list, mark-all-as-read, and accept-or-decline failure cases remain `UNVERIFIED` .

There are no notification form fields, and the screen has no validation groups or inline validation message text.

Open Notifications and identify the visible message

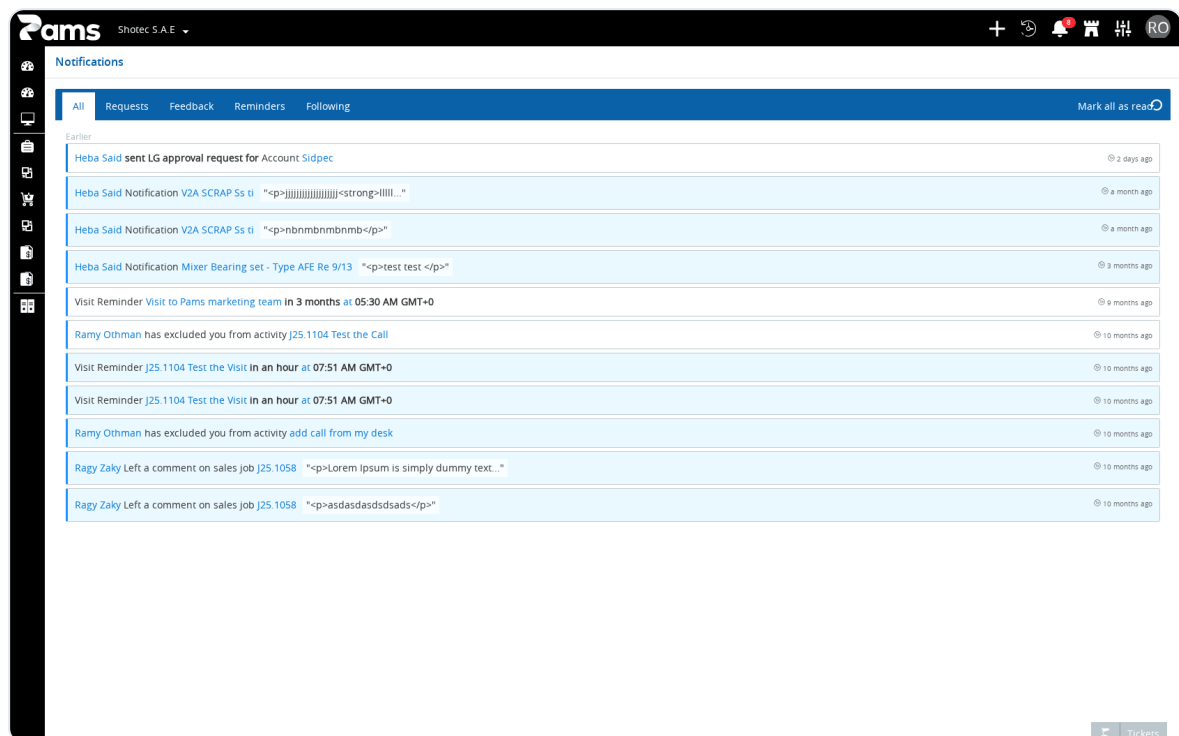

Check the notification screen to identify the message or notification category currently visible.

Prerequisites

- You know the notification route `/notifications` .

Steps

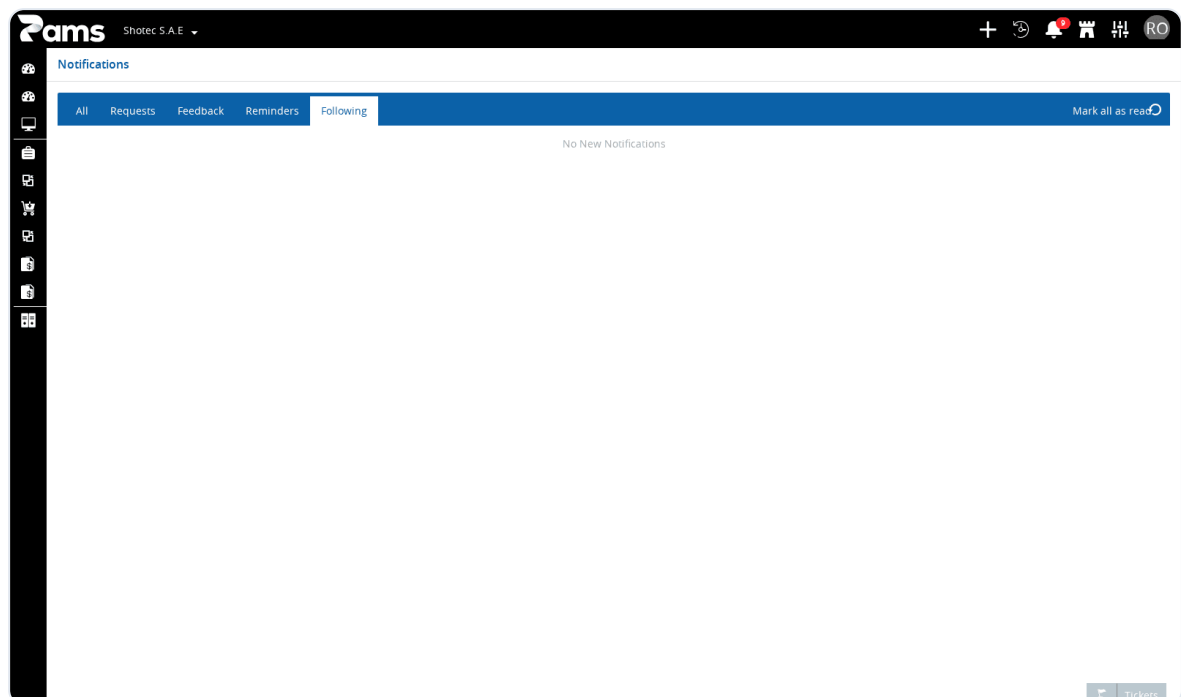

1. Open `/notifications` .
2. Confirm that the route is `/notifications` .

3. Select one notification category.

If you need to...	Select
See all notification categories	All
See requests	Requests
See feedback	Feedback
See reminders	Reminders
See followed notifications	Following

4. Check the period label and the notification message area.

5. Check the selected view.

If you see...	Then...
An empty list	Read No New Notifications .
Notification activity	Use the visible notification content to identify the category and period.

Result: The Notifications screen remains at `/notifications` , with the selected category visible and the current notification content or **No New Notifications** on screen.

Inspect the notification state

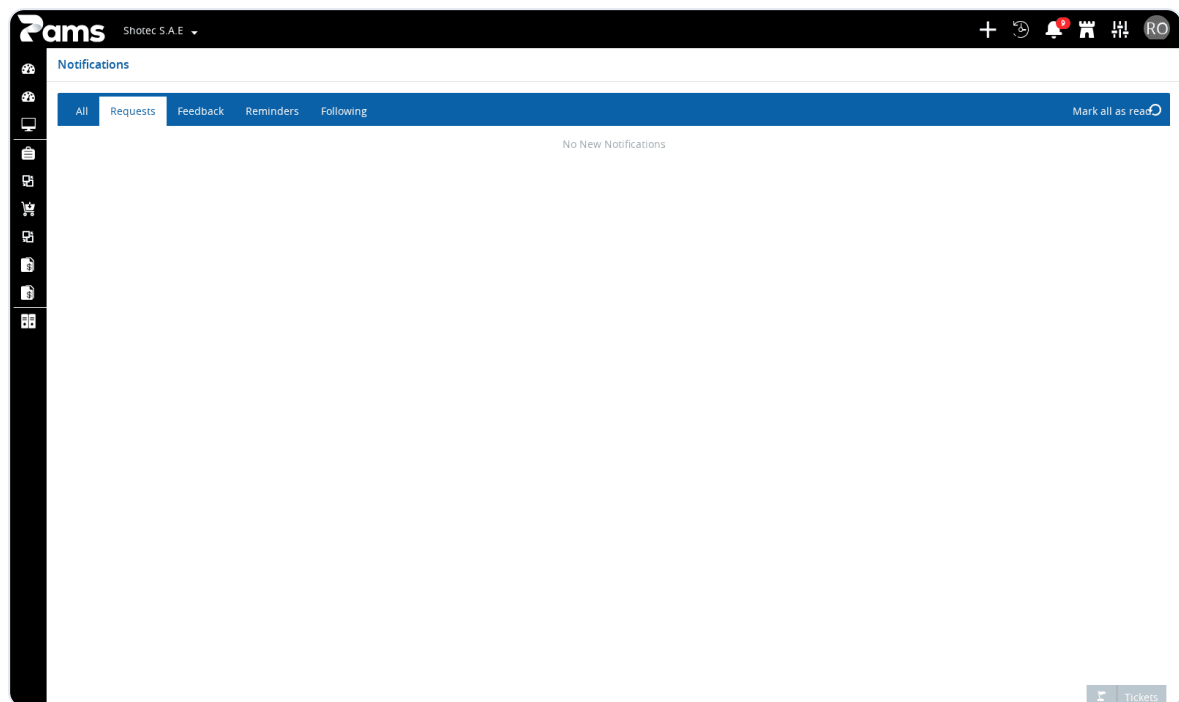

Notification content tells you what activity needs attention; it is separate from an error message about the notification operation itself.

Prerequisites

- You are on `/notifications` .

Steps

1. Check the notification tabs **All**, **Requests**, **Feedback**, **Reminders**, and **Following**.
2. Check for **Mark all as read** when you need to change the read state of the notification list.
3. For an unseen task or activity assignment, check for **Decline** and **Accept**.
4. When the selected view has no notifications, read `No New Notifications` .

The notification request and reminder text belongs to Notifications. In the Notification row, an Assignment result is `Accepted` or `Declined` .

The screen has no field labels or dialogs. Switching notification tabs does not show an error, validation, confirmation, or success message.

Result: You can distinguish notification content, assignment controls, and the empty-state message `No New Notifications` from an error message.

When a notification operation fails

Compare a failed operation with the cases below when notification loading, marking all notifications as read, or accepting or declining an assignment does not produce the expected result.

What you are checking	What to look for	Status
Notification list request fails	Check whether an error message appears after the operation fails.	UNVERIFIED
Mark-all-as-read request fails	Check whether an error message appears after the operation fails.	UNVERIFIED
Accept or decline request fails	Check whether an error message appears after the operation fails.	UNVERIFIED

Result: The failed-operation outcome is UNVERIFIED .

Continue from the result

Notification content questions belong to Notifications rather than to the general error-message list.

Steps

1. Confirm that the route remains /notifications .
2. Choose where to continue.

If you are checking...	Continue at...
Notification content	Open Notifications and identify the visible message
A failed operation	When a notification operation fails
A failed-request response that still needs investigation	Getting help

Result: You remain on /notifications after the check.
