

Browsing the ERP Apps Catalog

August 26, 2026

Opening the ERP Apps Catalog

If you already reviewed the broader ERP entry points in [Discovering ERP Products and Packages](#), the **ERP Apps Catalog** is the next place to narrow your options. In Sherkey ERP & Website Platform, this is a public browsing area, so you do not need to sign in or open any ERP workspace before using it.

When you arrive on the catalog page, focus on four main areas:

- the **search area** at the top of the catalog
- the **category filter** controls
- the **results count** showing how many apps are currently listed
- the **app card grid** where each module appears as a separate card

[SCREENSHOT: ERP Apps Catalog page showing the search area, category filter, results count, and app cards]

Each app card is a starting point for deeper research. Instead of making a decision from the listing alone, you can open a dedicated app page for any module that looks relevant. That detail page is where you continue evaluating the app before deciding whether it fits your business needs.

As you browse, remember that the catalog is designed for comparison. You can stay on the main page, scan several cards, switch categories, and watch the visible list update without losing your place. This makes it easier to compare options such as **Accounting**, **Sales & CRM**, **HR**, **Purchasing**, or **Reporting** before opening any one app in full.

If the page takes a moment to load, wait for the catalog content to appear. If you see a loading or error message instead of app cards, refresh the page or return later. Once the catalog is visible, you can begin reviewing modules directly from the listing.

Scanning Available Apps in the Catalog Grid

The main results area in Sherkety ERP & Website Platform shows apps as a grid of cards. This is the fastest way to get a broad view of what is available before you commit to reading a full app page. Start by scrolling through the grid and noting which modules appear most relevant to your business.

Each card gives you quick information you can use for comparison. Depending on the card content shown in the catalog, you can identify the **app name**, see its **category**, and use the card as a clickable path to the app's full detail page. That means you can compare several modules from the listing itself before opening any one of them.

Use the grid view to answer practical questions such as:

- Which modules belong to the same category?
- Which app names match the business area you are researching?
- Are there only a few options in a category, or several worth comparing?

The catalog does not always show every available app at once in the same way. What you see depends on your current browsing context, especially the category you have selected. As you change that context, the grid refreshes to match it. This helps you focus on a smaller, more relevant set of modules instead of scanning an unfiltered list.

A good approach is to first review the visible cards without opening anything. Compare names and category groupings, then open the most promising app pages in turn. After reading one detail page, return to the grid and continue with the next card. That pattern makes the catalog useful as a comparison workspace rather than just a list of links.

Filtering Apps by Category

The **category filter** is the quickest way to narrow the ERP Apps Catalog in Sherkety ERP & Website Platform. Instead of browsing the full listing, you can choose a category and immediately reduce the grid to a more focused set of apps.

1. Open the **ERP Apps Catalog** page.
2. Find the **category filter** near the top of the catalog.
3. Select the category you want to review.
4. Watch the app grid refresh to show only the modules assigned to that category.

[SCREENSHOT: Category filter on the ERP Apps Catalog with one category selected and the grid updated]

This is especially helpful when you already know the business area you want to explore. For example, if you want people management tools, switch to the **HR** category. If you are comparing sales-related options, move to **Sales & CRM**. If you want finance-related tools, review **Accounting**. The page updates in place, so you do not need to leave the catalog and start over each time.

You can also move between categories to compare groups of apps side by side over time:

1. Select one category and review the visible cards.
2. Change to a different category.
3. Compare the new list with what you saw previously.
4. Return to another category if you want a second look.

If the current category feels too narrow, clear it or switch to another one. Clearing the filter broadens the catalog again and brings back the larger listing. Changing the selected category re-focuses the page around a different group of modules. This makes category filtering the main tool for moving from broad discovery to targeted evaluation.

Using the Results Count to Judge Your Filtered List

Near the catalog controls in Sherkety ERP & Website Platform, you will see a **results count**. This number tells you how many apps currently match the category you are viewing. It updates as the catalog changes, so it works as a quick signal before you spend time reading every card.

When no narrow filter is active, the count reflects the broader catalog view. After you choose a category, the number changes to match only the apps in that group. This helps you judge the size of the list right away:

- A **higher count** usually means the category is broad and may need more comparison.
- A **lower count** means the category is more focused.
- A **very small count** can tell you that only a few modules fit that category.
- If no apps match, the count helps confirm that the current filter is too narrow or empty.

[SCREENSHOT: Results count displayed above the app grid with a category filter applied]

Use the count before opening any cards. If you select a category and see only a few results, you may want to inspect each one carefully. If you see many results, start by scanning names and categories in the grid before deciding which detail pages to open.

The count also helps you notice when a filter is still active. If the total seems smaller than expected, check the category filter first. In many cases, the lower number is not a missing-content problem—it simply means the catalog is still narrowed to one category.

As you switch categories, the results total updates immediately with the visible grid. That direct connection between the filter and the count makes it easier to understand whether you are looking at a broad market view or a tightly focused shortlist.

Opening an App Detail Page from the Catalog

Once you find a promising module in the catalog, open its dedicated app page to continue your evaluation. In Sherkety ERP & Website Platform, the catalog is the comparison layer, while the app detail page is the review layer. The detail page is where you move from quick scanning to closer inspection.

1. Browse the app cards in the current catalog view.
2. Click the card for the app you want to explore.
3. Review the dedicated app detail page.
4. Return to the catalog when you want to compare more apps.

[SCREENSHOT: App card in the catalog and the corresponding app detail page after selection]

This workflow is useful whether you started from the full catalog or from a filtered category. If you selected a category first, the detail page helps you evaluate one option within that narrowed list. After reviewing it, use your browser's back action or the site navigation to return to the catalog and continue comparing other apps from the same category.

Returning to the catalog is an important part of the process. It lets you keep your comparison flow going instead of treating each app as a separate search. For example, you might open one **HR** app, go back, open another card, then switch to **Reporting** and compare a different group.

If you want more structured evaluation after catalog browsing, the next stage is comparing website-level offers with ERP module options in [Comparing Website and](#)

[ERP Offerings](#). For app-by-app review from catalog to module page, this open-review-return pattern is the most practical way to work.

Fixing Common Catalog Browsing Issues

Most catalog issues in Sherkety ERP & Website Platform come from the current filter state rather than a problem with the page itself. Before assuming content is missing, check what is selected on the catalog screen.

If no apps appear after choosing a category, the first thing to inspect is the **category filter**. You may have selected a category with no visible matches in the current view. Clear the category or switch to a different one to bring back a broader list. Then watch the **results count** and the app grid together to confirm that the page has refreshed.

If the results count seems lower than expected, look again at the active category. A reduced total usually means the catalog is still narrowed. This is easy to miss if you changed categories earlier and forgot that the filter remained in place. Resetting the filter is the quickest way to confirm whether the lower number is caused by your current selection.

If an app detail page does not match the app you expected to open, return to the catalog and check which card you clicked in the current filtered list. When several apps are grouped closely together, it helps to pause and confirm the app name on the card before opening it again.

You may also run into temporary loading or error messages while the page is trying to display content. In that case:

- wait a moment for the catalog to finish loading
- refresh the page if the message stays visible
- return to the catalog later if the page still does not load

For more help recognizing loading, empty, and error states across Sherkety ERP & Website Platform, see [Understanding Loading Placeholders Empty States and Errors](#).

Overview

The **ERP Apps Catalog** in Sherkety ERP & Website Platform is a public browsing page for exploring ERP modules before making a deeper evaluation. It works best as a shortlisting tool: you scan app cards, narrow the list with the **category filter**, check the **results count**, and open individual app pages only when something looks relevant.

The main value of the catalog is speed. You do not need to sign in, create anything, or commit to a single module right away. Instead, you can compare several options from one screen. The catalog helps you move from broad product discovery to focused review without losing context.

Key things to remember:

- The catalog page includes a **search area**, **category filter**, **results count**, and **app card grid**.
- Each **app card** leads to a dedicated app detail page.
- The **category filter** narrows the visible list to a specific group of modules.
- The **results count** changes with the active filter and helps you judge list size quickly.
- Returning from an app page to the catalog lets you continue comparing modules efficiently.

This document focuses on browsing behavior inside the catalog itself. For broader ERP entry points and package discovery, return to [Discovering ERP Products and Packages](#). For the next step after catalog browsing—understanding how ERP options relate to website and service offers—continue with [Comparing Website and ERP Offerings](#).

Prerequisites

You do not need a login or an active ERP workspace to browse the **ERP Apps Catalog** in Sherkety ERP & Website Platform. This is a public-facing part of the site, so most visitors can start directly from the website navigation or another ERP-related page.

Before you begin, it helps to have:

- a clear idea of the business area you want to explore, such as **Accounting**, **HR**, **Sales & CRM**, **Purchasing**, or **Reporting**
- enough time to compare several app cards instead of opening the first result immediately
- a stable internet connection so the catalog page and app detail pages load properly

It is also useful if you already understand the basic ERP discovery paths covered in [Discovering ERP Products and Packages](#). That earlier guide explains how buyers first

reach ERP-related pages in Sherkety ERP & Website Platform. This current guide assumes you are already at the point of narrowing choices inside the catalog.

Keep these practical expectations in mind:

- You will browse from the public website, not from the admin area.
- You will use visible page controls such as the **category filter** and app cards.
- You may move back and forth between the catalog and app detail pages several times.
- The visible app list can change based on the selected category.

If you want to continue after this stage, the next document is [Comparing Website and ERP Offerings](#), which helps you connect what you see in the app catalog with the broader offers presented across the website.
