

Responding to Success Warning and Error Feedback

August 25, 2026

Recognizing Feedback After You Save, Submit, or Retry

In Sherkety ERP & Website Platform, feedback usually appears immediately after you click **Save**, **Submit**, or **Retry**. You may see a small message pop up briefly on the screen, a notice near the top of the page, or a message attached directly to a field in the form you were editing. On content and admin pages such as **Dashboard**, **Content**, **Users**, **Settings**, **SEO**, **Services**, and **Pricing**, these messages help you understand whether your last action finished successfully or needs attention.

A **success** message confirms that the action you just took worked. For example, after saving changes on a content editing screen or updating settings in the admin area, a success message means your changes were accepted. A **warning** message means Sherkety ERP & Website Platform wants you to review something before you move on. The action may still go through, but the message is asking you to double-check details. An **error** message means the action did not finish. If you tried to save, submit, or retry and an error appears, you need to correct something or try again before the change is completed.

Always connect the message to the button you just used. If you clicked **Save**, the feedback applies to saving your current edits. If you clicked **Submit**, it applies to sending or finalizing the form. If you clicked **Retry**, it applies to a previous action that did not complete the first time.

When the message confirms success, you can continue working, leave the page, or move to the next task. When the message asks for review or correction, stay on the current page and look for highlighted fields, notices at the top, or buttons that remain unavailable. For a broader explanation of notification types, see [Understanding Notification Types and What They Mean](#).

Interpreting Success Messages After Completing an Action

A success message in Sherkety ERP & Website Platform means your action finished properly. After clicking **Save**, it usually means the changes on the current page, form, or record were stored. This is common when updating website content, editing pricing details, changing SEO information, or adjusting settings in the admin area. If you were editing text or page content, a success message tells you those updates were accepted and you can safely move away from the page without losing the latest saved version.

After clicking **Submit**, a success message usually means the action is fully completed rather than simply stored for later. In practical terms, this means Sherkety ERP & Website Platform has accepted the form or request and no more correction is needed before the workflow continues. If you were sending a completed form, the success message is your sign that the form went through.

Do not rely on the message alone. Look for other signs on the screen that confirm the result. You may notice updated values, a changed status label, a refreshed section, a list view reappearing, or an action button becoming unavailable because the step is already complete. For example, after a successful save in an admin section, the page may remain open with the new values still visible. In other cases, you may return to a list where the updated item now reflects your changes.

A successful **Retry** means a previous interruption has been cleared. If an earlier save or submit attempt failed and you clicked **Retry**, a success message means you can continue normal work. Check that the page now shows the expected result, such as saved content, updated settings, or a completed action state.

[SCREENSHOT: success notification with updated page values after saving]

If you are unsure whether the change really took effect, reopen the item or refresh the page and confirm that the latest information is still there.

Reviewing Warnings Before You Continue

A warning message in Sherkety ERP & Website Platform is not the same as an error. It does not always stop you, but it does mean you should pause and review what the screen is telling you. Warnings often appear when something looks incomplete, unusual, or worth checking before you continue. You might see the warning near the top of the page, inside a notice area, or beside a field that needs attention.

When a warning appears, read the full message before clicking anything else. The wording usually tells you whether the message is simply informational, whether you need to confirm your choice, or whether you should go back and adjust part of the

form. For example, if you are editing content, settings, pricing, or SEO details and a warning appears after **Save** or **Submit**, the page may still allow you to continue, but Sherkety ERP & Website Platform is signaling that part of the information should be reviewed first.

Field-level warnings are especially useful because they point you to the exact area that needs checking. Look for highlighted boxes, messages under a field, or sections that remain visually marked after the warning appears. If the warning is shown at the top of the page, scroll through the form and look for anything that stands out, including required fields, incomplete selections, or values that may not match the rest of the page.

[SCREENSHOT: warning notice at the top of a form with a highlighted field below]

Continue only when the warning clearly allows it and the information still matches your intent. If the warning suggests missing details, inconsistent values, or a choice that should be confirmed, return to the relevant fields and update them before saving again. If you need a refresher on how warnings differ from other notices, see [Recognizing Warnings Errors and Dismissible Notices](#).

Fixing Errors That Prevent Saving or Submitting

An error message in Sherkety ERP & Website Platform means your action did not complete. If you click **Save** or **Submit** and an error appears, the page has not accepted the change yet. Unlike a warning, an error is blocking. You need to fix the problem before Sherkety ERP & Website Platform can finish the action.

Start by reading the error text carefully. Some errors appear at the top of the page, while others are shown directly next to the field causing the problem. Look for missing required entries, invalid values, incomplete selections, or fields that remain highlighted after the message appears. If the page contains several sections, scroll through the entire form instead of checking only the area you were just editing. The issue may be in a different section that still needs input.

If a field is marked as required, enter the missing information. If a value looks incorrect, update it using the available field options, dropdown choices, or text entry box. If a selection has not been made, choose the correct option and review any related fields that may depend on it. On admin pages such as **Content**, **Users**, **Settings**, **SEO**, **Services**, or **Pricing**, errors often clear as soon as the missing or invalid information is corrected.

[SCREENSHOT: blocking error message with required fields highlighted]

After making your corrections, click **Save** or **Submit** again. Watch for a new message and confirm that the error no longer appears. If the same error returns, review all highlighted fields one more time and make sure no required section was skipped. When the action succeeds, you should see a confirmation message and visible signs that the page accepted your changes, such as refreshed values or updated status information.

Retrying an Action After a Failed Attempt

In Sherkety ERP & Website Platform, **Retry** is used when an earlier action did not finish and the screen gives you a chance to try again. This can happen after a temporary interruption, a loading problem, or another issue that prevented the page from completing the request the first time. You may see **Retry** in a message area, near an error notice, or on a page that failed to load or save correctly.

Before you click **Retry**, read the original message. This matters because not every failed action should be retried immediately. If the message suggests a temporary issue, retrying may solve it without any other changes. If the message points to missing information, an invalid entry, or something incomplete in the form, go back and fix the data first instead of repeating the same failed action.

After clicking **Retry**, watch the screen for signs that Sherkety ERP & Website Platform is working on the request. You may briefly see a loading state, a refreshed notification, or a page update. If the retry succeeds, look for the same confirmation signs you would expect after any successful action: a success message, updated values, a changed status, or the disappearance of the earlier error.

[SCREENSHOT: retry option shown after a failed action]

If the same failure happens again, stop and decide what kind of problem you are dealing with. Retry again only if the message still suggests a temporary interruption. If the message points to the form itself, edit the record before trying once more. If repeated retries do not help and the message stays the same, note the exact wording, the page you were on, and whether you clicked **Save**, **Submit**, or **Retry**. That information is useful when reporting the issue to an administrator.

Handling Common Feedback Problems in the Interface

A success message appears, but the expected change is not visible

1. Refresh the current page.

2. Reopen the record, page, or admin section you were editing.
3. Check whether the saved values, updated text, or changed status are actually present.
4. If you were working in **Content**, **SEO**, **Services**, **Pricing**, or **Settings**, compare the visible values on the screen with what you expected to save.
5. If the old information still appears, repeat the action and watch for any warning or error that may have been missed.

A warning keeps returning after edits

1. Read the warning text again from start to finish.
2. Recheck every highlighted field, not just the one closest to the message.
3. Review related sections of the same form for missing details or incomplete selections.
4. Save again only after all marked areas have been updated.
5. If the warning still returns, confirm that your latest edits remained in place before trying another change.

An error message is too general to act on

1. Look for field-level messages under inputs or beside dropdowns.
2. Scan the page for required markers, empty fields, or sections that appear visually highlighted.
3. Check whether an action button remains disabled, which can signal that something is still incomplete.
4. Review the full form from top to bottom instead of focusing on one section.

Retry does not resolve the issue

1. Copy or note the exact message text shown on the screen.
2. Record which button you used: **Save**, **Submit**, or **Retry**.
3. Identify the page or record involved, such as **Content**, **Users**, **Settings**, **SEO**, **Services**, or **Pricing**.
4. Stop retrying if the same message keeps returning with no visible change.
5. Share those details with an administrator so they can investigate the repeated failure.

Overview

When you work in Sherkety ERP & Website Platform, the message that appears after **Save**, **Submit**, or **Retry** is your main clue about what happened. A success message means the action finished and you should confirm the visible result on the page. A warning means you should review the information before moving on, even if the page may still allow you to continue. An error means the action did not complete and you need to correct something or try again.

The most useful habit is to match the feedback to the action you just took. If you clicked **Save**, check whether the current edits remained on the page. If you clicked **Submit**, confirm that the item moved forward and no further correction is required. If you clicked **Retry**, look for a loading state, a refreshed message, or a changed status that shows the earlier problem has been cleared.

You do not need to guess what to do next. Sherkety ERP & Website Platform usually points you in the right direction through top-of-page notices, highlighted fields, disabled buttons, or updated values. When the message is positive, confirm the result and continue. When the message asks for review, stay on the page and inspect the marked areas. When the message blocks the action, correct the problem and run the action again.

If you want to understand how smaller on-page hints guide you before or during an action, continue with [Using Inline Guidance and Speech Bubble Messages](#).

Prerequisites

Before using the guidance in this page, you should already be comfortable recognizing the basic notification styles used in Sherkety ERP & Website Platform. In particular, it helps to know the difference between temporary pop-up confirmations, warning notices, and blocking errors. If you have not reviewed that yet, read [Understanding Notification Types and What They Mean](#).

You should also be able to perform a basic action that produces feedback, such as:

- clicking **Save** after editing content or settings
- clicking **Submit** on a completed form
- clicking **Retry** after a failed action or interrupted request

This page is most useful when you are already working on screens where changes can be made, including admin areas such as **Dashboard**, **Content**, **Users**, **Settings**,

SEO, Services, and Pricing, or public-facing forms where a submission can succeed, warn, or fail. You do not need advanced knowledge of Sherkety ERP & Website Platform, but you should be familiar with moving between pages, reading notices on screen, and checking whether fields are highlighted after an action.

If you are still learning how feedback first appears, start with [Understanding Toast Messages and Action Feedback](#) and [Recognizing Warnings Errors and Dismissible Notices](#). Those pages explain the message styles. This page focuses on what to do after the message appears.
