

Understanding Saved Display Preferences

August 26, 2026

Seeing How the Site Remembers Your Display Choice

In **Sherkety ERP & Website Platform**, your display choice is remembered after you use the **theme switcher** in the site header, navigation area, or admin interface. If you already reviewed [Using Light and Dark Display Modes](#), the important next detail is what happens after you make that choice. When you switch to **Light**, **Dark**, or **System** (when that option is shown), the page updates right away and your preference is kept for later visits in that same browser.

What you see depends on the options available in the menu:

- **Light** shows bright page backgrounds with darker text.
- **Dark** shows darker backgrounds with lighter text.
- **System** or **Default** follows the appearance setting already active on your device.

This remembered choice is meant to make browsing feel consistent. If you open the homepage, move to service pages, browse ERP app pages, or sign in to the admin area in the same browser, Sherkety ERP & Website Platform can continue showing the mode you selected instead of asking you again on every page.

[SCREENSHOT: theme switcher in the website or admin header showing Light, Dark, and System options]

It is important to treat this as a **personal browser preference**, not a shared account setting. If you choose **Dark** on your laptop, that does not automatically change the display for another person using a different device. It also does not mean every browser on your own device will match. For example, a choice saved in one browser may not carry over to another browser, a private window, or a separate browser profile. The remembered display mode belongs to where you made the selection, not to all users of Sherkety ERP & Website Platform everywhere.

Choosing a Different Display Mode

If you want a different look, go back to the same **theme switcher** you used before. In Sherkety ERP & Website Platform, this control is typically available in a visible

navigation area such as the **header**, a compact **menu**, or an account-related menu inside the admin experience. Open that control and select the mode you want.

You may see choices such as:

- **Light**
- **Dark**
- **System** or **Default**

As soon as you click one of these options, the page appearance changes immediately. You do not need to hunt for a separate **Save** button. The background color, text contrast, and surrounding interface elements update at once so you can tell whether the new mode is comfortable for reading and navigation.

This instant change is especially useful when moving between public pages and admin pages. If you are reading service information, comparing ERP modules, or working inside content and settings screens, you can switch the display and continue without reloading your work manually. The selected mode is stored as part of that action.

[SCREENSHOT: open theme menu with the current selection highlighted]

A few practical examples:

- If a bright page feels too intense, choose **Dark** and continue browsing.
- If you prefer a brighter editing workspace, choose **Light**.
- If you want Sherkety ERP & Website Platform to match your device automatically, choose **System**.

Because the preference is saved right away, changing your mind is simple. Open the same menu again and pick another option. The newest selection replaces the previous one in that browser. If you are looking for where the control lives in different parts of the interface, keep an eye on the top navigation area first, since that is where display controls are commonly placed.

Knowing When the Saved Preference Applies

Your saved display preference usually takes effect the next time you open **Sherkety ERP & Website Platform** in the **same browser** where you made the choice. That means if you selected **Dark** while browsing a public page, then return later in that same browser, the site should open in **Dark** again instead of going back to the default appearance.

This remembered mode is not limited to one page. In normal use, it carries across multiple areas, including:

- public website pages
- service and pricing pages
- ERP product pages
- admin pages you can access after signing in

That consistency is the main benefit of a saved display preference. You do not need to switch the theme again every time you move from one part of Sherkety ERP & Website Platform to another.

If you choose **System** or **Default**, the behavior is slightly different. Instead of forcing **Light** or **Dark**, Sherkety ERP & Website Platform follows the appearance setting already active on your device or browser. So if your computer is set to dark appearance, the site may open in dark styling. If your device changes back to light appearance later, the site may follow that change as well.

Keep these limits in mind:

- A different browser may not know your saved choice.
- A different browser profile may act like a fresh start.
- A private or incognito window may not keep the preference after you close it.
- Another device, such as your phone or tablet, may show a different mode until you choose one there too.

[SCREENSHOT: same site viewed on two pages with the same theme applied]

If the appearance seems to change unexpectedly, first check whether you are still using the same browser and whether **System** mode is following your device setting rather than a manually forced theme.

Changing or Resetting the Preference Later

You can change your saved display preference at any time by returning to the same **theme switcher** or **display menu**. In Sherkety ERP & Website Platform, there is no special reset screen required for this. Just open the menu and select a new option. Your latest choice replaces the old one in that browser.

Common ways to update the preference:

- Select **Light** to force a bright interface.

- Select **Dark** to force a darker interface.
- Select **System** or **Default** to stop forcing one mode and let your device decide.

This is helpful if your needs change during the day. You might prefer **Light** while editing content in the admin area, then switch to **Dark** for evening reading on public pages. Because the setting updates immediately, you can test each option and keep the one that feels best.

If you want to remove the remembered choice entirely, the result usually comes from clearing your browser's saved site data rather than from a button inside Sherkety ERP & Website Platform. When browser storage, cookies, or saved website data are removed, the theme preference may disappear too. After that, the site may return to its default behavior or follow **System** mode until you choose a theme again.

[SCREENSHOT: theme menu reopened to switch from Dark to System]

You may also notice a reset-like effect in these situations:

- you clear browsing data
- your browser automatically deletes site data on exit
- you use a private window
- a browser extension removes saved website preferences

If the display no longer matches what you picked earlier, simply open the theme menu again and choose the mode you want. That creates a fresh saved preference for your current browser session.

Understanding What Different Users Should Expect

Saved display preferences help different people in different ways across **Sherkety ERP & Website Platform**, but the key idea stays the same: the preference is personal to the browser being used.

For **Business Services visitors** and **prospective ERP buyers**, the biggest benefit is consistency while browsing. If you choose **Dark** on the homepage, that same look can continue while you read company registration content, compare services, explore pricing, and review ERP app pages such as Accounting, HR, Sales & CRM, Purchasing, or Reporting. This makes long browsing sessions more comfortable and avoids repeated theme changes between pages.

For **Content Editors**, the saved preference affects how the editing experience appears in their current browser. If you work with inline editing tools, content screens,

preview areas, or page management views, the chosen display mode changes how those screens look for you. It does not change the saved content itself. It only changes the way the interface is shown while you work.

For **Administrators**, it is important to separate a personal display preference from broader site controls. Choosing **Light**, **Dark**, or **System** in your own browser does **not** push that appearance to all other users. It does not automatically change what visitors see on their devices, and it does not replace branding or site-wide appearance settings managed elsewhere in the admin area.

Key expectations:

- **Visitors** get a more consistent reading experience.
- **Editors** see their preferred mode while managing content.
- **Administrators** should not expect personal theme changes to become global settings.

If you are working across teams, remember that each person may see Sherkety ERP & Website Platform in a different mode depending on what they selected in their own browser.

Fixing Cases Where the Saved Display Does Not Stick

If Sherkety ERP & Website Platform does not remember your display choice, start with the simplest check: make sure you are returning in the **same browser**, on the **same device**, and in the **same browser profile** where you originally selected the theme. A saved preference in one browser window does not always carry over to another browsing setup.

The most common reasons the preference does not stick are:

- the browser is blocking site storage
- cookies or saved website data are being cleared
- you are using a private or incognito window
- a browser extension removes saved data automatically
- you selected **System**, and your device appearance changed

If you suspect a storage issue, try this practical test:

- choose **Light** or **Dark** from the theme menu
- move to another page in Sherkety ERP & Website Platform
- refresh the page or reopen the site later in the same browser

If the site immediately forgets the choice, your browser may not be keeping the saved preference.

When **System** mode seems inconsistent, compare the site's appearance with your device's current light or dark setting. If your phone, tablet, or computer is set to switch appearance automatically by time of day, Sherkety ERP & Website Platform may appear to "change on its own" even though it is correctly following the device setting.

[SCREENSHOT: theme menu with System selected while device appearance differs]

If the issue continues, switch from **System** to a fixed option like **Light** or **Dark** and test again. That helps you tell whether the problem is with saved browser data or simply with the device-controlled appearance. For related interface behavior such as loading and error messages, see [Understanding Loading Placeholders Empty States and Errors](#).

Overview

Saved display preferences in **Sherkety ERP & Website Platform** are designed to make the interface feel familiar each time you return. After you use the **theme switcher** and choose **Light**, **Dark**, or **System**, that choice is typically remembered in your current browser. The next time you open public pages, browse ERP product content, or return to the admin area, the same appearance is usually applied automatically.

The main points to remember are:

- your choice is saved as soon as you select it
- the preference usually follows you across multiple pages
- the saved mode belongs to the current browser and device
- **System** follows your device appearance instead of forcing one mode
- clearing browser data can remove the remembered setting

This behavior is especially useful if you spend time moving between different parts of Sherkety ERP & Website Platform. A visitor can keep the same reading experience while exploring services and ERP modules. A content editor can keep the same visual comfort while working in editing screens. An administrator can use a preferred mode without affecting what other users see.

If the remembered display does not behave as expected, first check whether you are in the same browser and whether **System** mode is following your device settings. In

many cases, what looks like a broken preference is simply a different browser profile, a private window, or cleared site data.

For a broader view of how theme controls behave as you move between different areas, continue with [Using Theme Switching Across the Platform](#).

Prerequisites

You do not need any special setup before using saved display preferences in **Sherkety ERP & Website Platform**, but a few conditions make the feature work as expected.

Before this topic, it helps if you already know how to find and use the **theme switcher**. If you have not done that yet, read [Using Light and Dark Display Modes](#). That guide explains the visible theme options and how to switch between them.

To follow the steps in this document, you should have:

- access to **Sherkety ERP & Website Platform** in a web browser
- a visible **theme switcher** or display option in the page header, menu, or admin area
- permission to keep normal browser site data so your preference can be remembered

You do **not** need:

- an admin role
- a special settings screen
- a separate save action
- any account-wide configuration

This topic applies whether you are:

- browsing public pages as a visitor
- reviewing ERP offerings as a prospective buyer
- signing in as a content editor
- working in the admin area as an administrator

If you are testing saved preferences, use the same browser and device throughout. That gives you the clearest result when checking whether **Light**, **Dark**, or **System** is being remembered correctly. Once you are comfortable with that behavior, the next

useful step is seeing how theme switching behaves as you move between public and admin experiences in [Using Theme Switching Across the Platform](#).
